Q-COMMERCE ESSENTIALS

QUICKU

Faster Decisions. Smarter Commerce.

15 APRIL 2026

KEY FINDING

- Significant drop-off occurs at the payment stage, despite strong engagement in earlier steps
- Traffic quality is not the issue — users across channels show similar behavior patterns
- High-intent users still fail to complete transactions, indicating friction in checkout/payment
- Payment data captures successful transactions only, limiting visibility into failed attempts
- QRIS & Virtual Account dominate usage, making them the highest-impact optimization targets

BUSINESS IMPACT (FORECASTING)

- Improving payment conversion from 68% → 80–85% can generate:

👉 +6K to +9K additional transactions

- Small improvements at the final step yield disproportionate gains in revenue

EXECUTIVE SUMMARY

PROBLEM STATEMENT

Ineffective use of data and absence of segmentation result in suboptimal decision-making, limiting growth in high-quality users, transaction performance, and operational efficiency.

OBJECTIVES

Identify key bottlenecks in the purchase funnel and quantify opportunities to improve conversion and revenue.

DEFINING PROBLEM

Define business problems, objectives, and project scope by aligning with stakeholders to ensure clear direction and expected outcomes.

DATA PREPARATION

Extract, clean, and transform data using SQL to ensure data accuracy, consistency, and readiness for analysis.

DATA ANALYSIS

Perform exploratory data analysis (EDA) and generate insights using SQL queries to identify patterns, trends, and key business drivers.

RECOMMENDATION

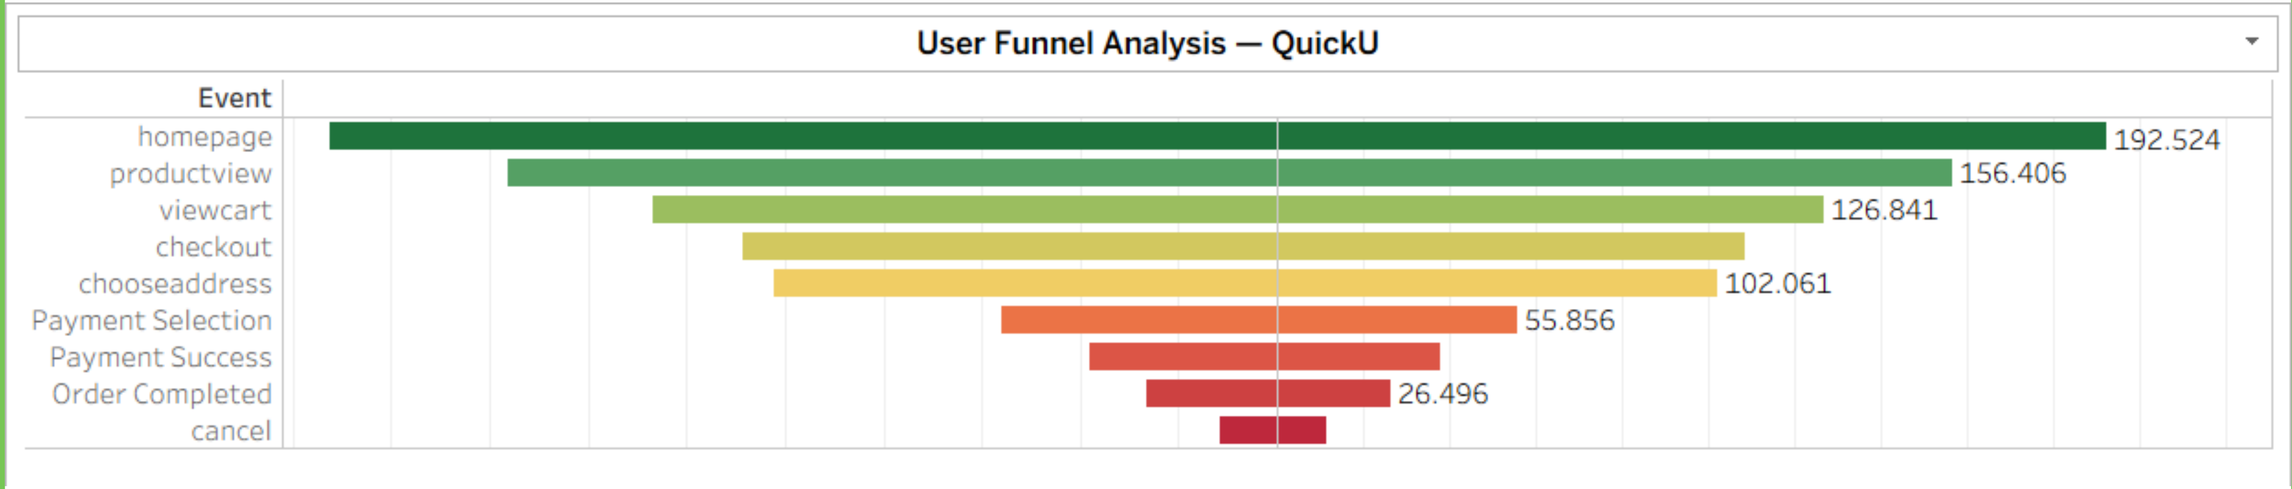
Develop actionable recommendations based on insights to improve performance, reduce churn, and optimize business strategies.

DATA VISUALIZATION

Present insights through dashboards and visualizations (e.g., Tableau/Looker Studio) to support data-driven decision-making

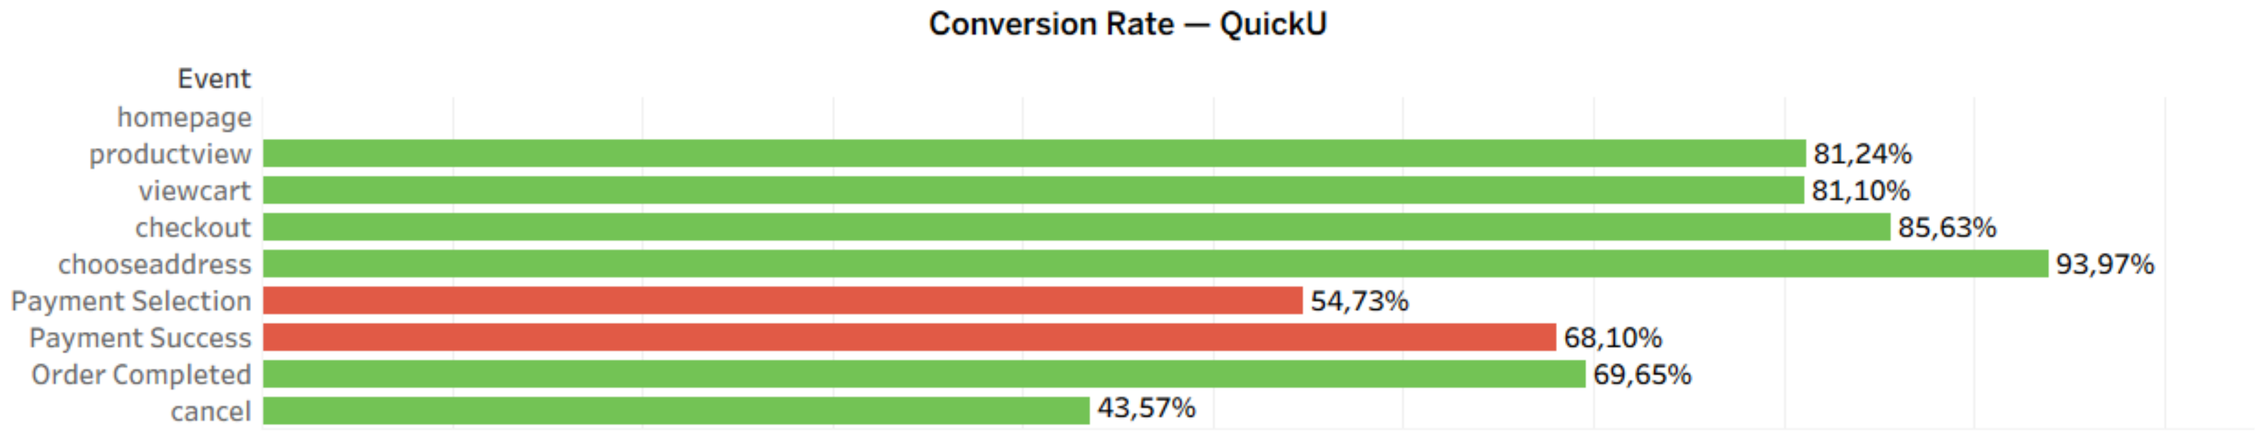
ANALYTICS FRAMEWORK

USER FUNNEL ANALYSIS



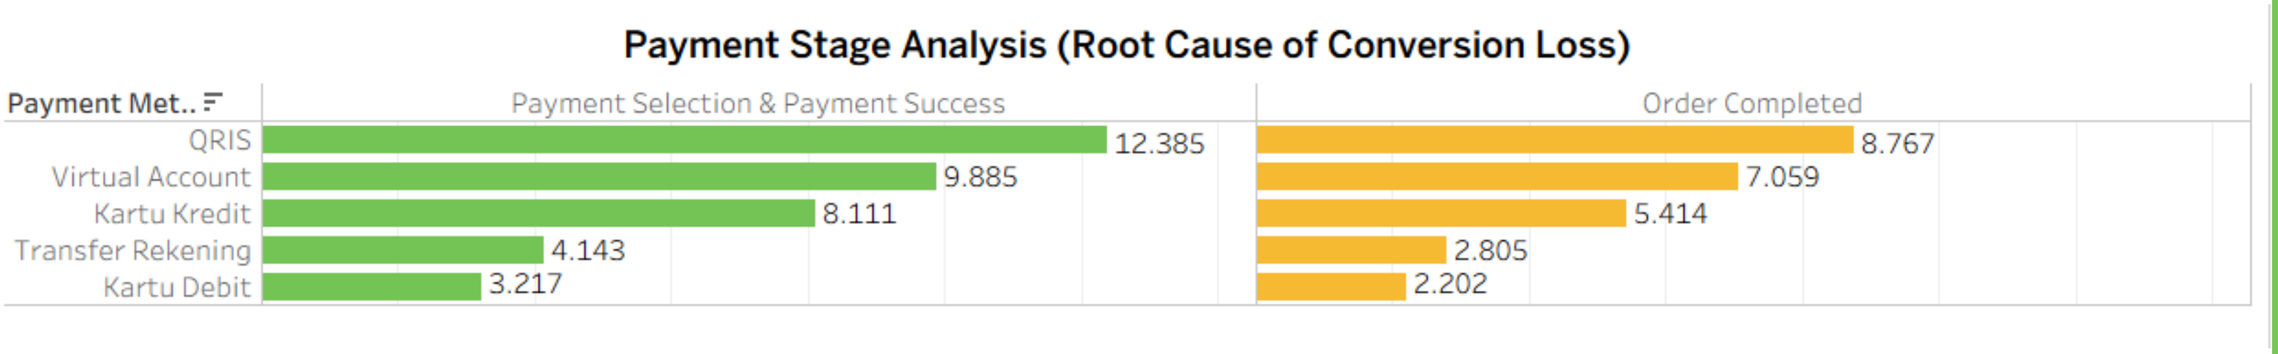
While user interest is high in the early stages, a sharp decline after checkout highlights a critical bottleneck in the conversion process.

CONVERSION RATE ANALYSIS



Conversion rates remain stable through most stages, but drop significantly at the payment selection step, suggesting a key friction point in the checkout experience.

PAYMENT FUNNEL PERFORMANCE — QUICKU



While QRIS shows the highest adoption at the payment stage, drop-offs between payment success and order completion suggest operational or user experience issues in finalizing transactions.

RECOMMENDATION

Recommended Actions	Expected Impact	Priority
Simplify checkout experience (reduce steps, streamline flow)	Reduces drop-off at final stage and improves payment completion rate	HIGH
Optimize high-usage methods (QRIS & Virtual Account)	Maximizes conversion uplift due to high traffic volume (highest leverage)	HIGH
Improve payment reliability (reduce errors, latency)	Prevents transaction failure and increases user trust	HIGH
Enhance payment UX clarity (clear CTA, feedback, confirmation)	Reduces confusion and improves consistency in completion	MEDIUM
Add trust signals (security badges, confirmation messaging)	Increases confidence and reduces hesitation during payment	MEDIUM
Evaluate low-performing methods (e.g., Debit)	Reallocates focus to higher-impact payment channels	LOW

Payment optimization offers the highest-impact opportunity,
where small improvements can significantly increase overall conversion and revenue.

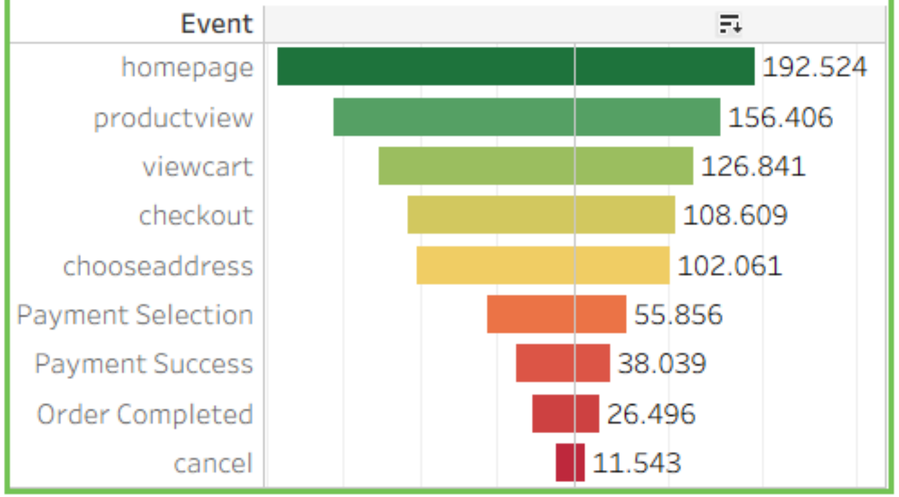
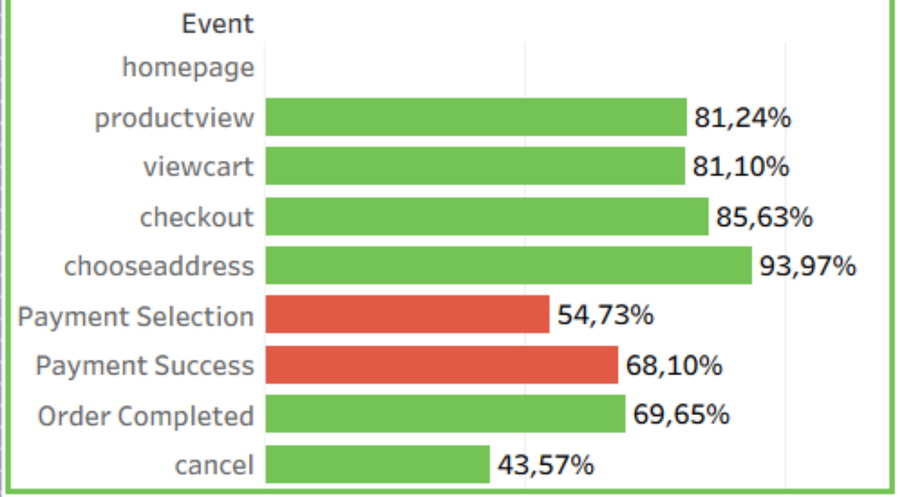
User Funnel Analysis — QuickU

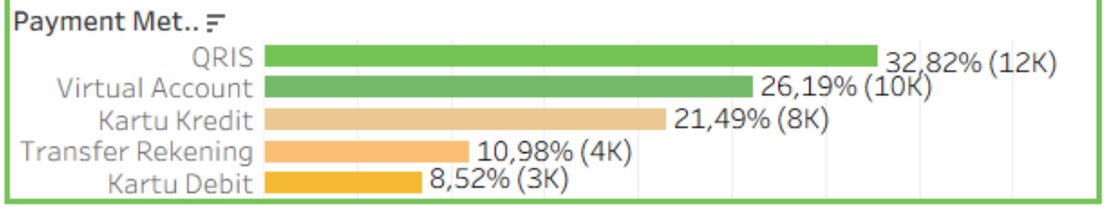


Conversion Rate — QuickU



Payment Stage Analysis (Root Cause of Conversion Loss)

Payment Share



KEY INSIGHTS

- Major drop occurs at the payment stage (~54% → 68%)
- Conversion is consistent across traffic and user segments, indicating the issue is not driven by acquisition or user quality
- High-intent users fail to complete transactions, pointing to friction in the payment process
- QRIS and Virtual Account dominate usage, making them the highest-impact optimization targets
